Lecture 10: Function evaluation, the AST

Tiago Cogumbreiro

Today we will learn...

- (revisit) function evaluation
- (revisit) the abstract syntactic tree

```
(define x 10)
(define (f x)
  (+ x 20))
(f 30)
```

What is the output of this program?

```
(define x 10)
(define (f x)
  (+ x 20))
(f 30)
```

Output: 50

Because, parameter x shadows the outermost definition.

```
(define x 10)
(define f (lambda (x) (+ x 20)))
(f 30)
```

What is the output of this program?

```
(define x 10)
(define f (lambda (x) (+ x 20)))
(f 30)
```

Output: 50

The code above is **equivalent** to the code below: (define (f x) (+ x 20))

```
(define (factory k)
  (lambda () k))
(factory 10)
```

```
(define (factory k)
    (lambda () k))

(factory 10)

Output: #procedure>
Although if Racket displayed code, we would get: (lambda () 10)

((factory 10))
; Outputs: 10
```

Step-by-step evaluation

Why is factory replaced by a lambda?

User input

```
(define (factory k)
  (lambda () k))
```

Internal representation

```
(define factory
  (lambda (k)
        (lambda () k)))
```

Looking at function application more closely

```
(define (f x y)
    (lambda (b)
        (cond [b x] [else y])))

(define g (f 1 2))
g
```

Q1: What is the output of this program?

```
(define (f x y)
    (lambda (b)
        (cond [b x] [else y])))

(define g (f 1 2))
g
```

Output: (lambda (b) (cond [b 1] [else 2]))

Q2: How do I call g to obtain 1?

Q1: What is the output of this program?

```
(define (f x y)
    (lambda (b)
        (cond [b x] [else y])))

(define g (f 1 2))
g
```

Output: (lambda (b) (cond [b 1] [else 2]))

Q2: How do I call g to obtain 1?

Solution: (g #t)

The abstract syntactic tree (AST)

Representing code as data structures

The AST of values

```
value = number | void | func-dec
func-dec = (lambda ( variable* ) term+ )
```

Implementation

```
(define (r:value? v)
  (or (r:number? v)
        (r:void? v)
        (r:lambda? v)))
(struct r:void () #:transparent)
(struct r:number (value) #:transparent)
(struct r:lambda (params body) #:transparent)
```

How do we represent?

```
1. 10
```

2. (void)

3. (lambda () 10)

AST

The AST of values

```
value = number | void | func-dec
func-dec = (lambda ( variable* ) term+ )
```

Implementation

```
(define (r:value? v)
  (or (r:number? v)
        (r:void? v)
        (r:lambda? v)))
(struct r:void () #:transparent)
(struct r:number (value) #:transparent)
(struct r:lambda (params body) #:transparent)
```

How do we represent?

- 1.10
- 2. (void)
- 3. (lambda () 10)

AST

```
(r:number 10)  ; ← 1
(r:void)  ; ← 2
(r:lambda (list) ; ← 3
    (list (r:number 10)))
```

The AST of expressions

```
expression = value | variable | apply apply = ( expression+ )
```

Implementation

```
(define (r:expression? e)
  (or (r:value? e)
        (r:variable? e)
        (r:apply? e)))
(struct r:variable (name) #:transparent)
(struct r:apply (func args) #:transparent)
```

How do we represent?

```
1. x
2. (f 10)
AST
```

The AST of expressions

```
expression = value | variable | apply
apply = ( expression+ )
```

Implementation

```
(define (r:expression? e)
  (or (r:value? e)
        (r:variable? e)
        (r:apply? e)))
(struct r:variable (name) #:transparent)
(struct r:apply (func args) #:transparent)
```

How do we represent?

```
1. x
2. (f 10)
```

AST

```
; 1:
(r:variable 'x)
; 2:
(r:apply
  (r:variable 'f)
  (list (r:number 10)))
```

The AST of terms

```
term = define | expression
define = ( define identifier expression ) | ( define ( variable+ ) term+)
```

```
(define (r:term? t)
  (or (r:define? t)
        (r:expression? t)))
(struct r:define (var body) #:transparent)
```

Which Racket code is this?

The AST of terms

```
term = define | expression
define = ( define identifier expression ) | ( define ( variable+ ) term+)
(define (r:term? t)
 (or (r:define? t)
      (r:expression? t)))
(struct r:define (var body) #:transparent)
 Which Racket code is this?
                                                             Answer 1
                                                              (define (f y) (+ y 10))
  (r:define (r:variable 'f)
    (r:lambda (list (r:variable 'y))
                                                             Answer 2
      (list
        (r:apply (r:variable '+)
                                                              (define f
                (list (r:variable 'v) (r:number 10))))))
                                                                (lambda (y) (+ y 10)))
```
