### CS720

Logical Foundations of Computer Science

Lecture 19: Simply Typed Lambda Calculus (STLC)

Tiago Cogumbreiro

#### What we have learned so far

- 1. Learned a new programming language called Coq
- 2. Exercised logic programming and functional programming
- 3. Formal proof development (inductive definitions, proofs by induction, case analysis)
- 4. Specify mathematically software systems (ie, formalization process)
- 5. Designed an imperative programming language (control flow, memory)
- 6. Proved the correctness of compiler transformations (constant folding)
- 7. Designed a program verification system (Hoare logic)
- 8. Proved the correctness of programs (using Hoare logic)
- 9. Formalized a static analysis (type system)

### Overview: $\lambda$ -calculus

- We want to module the key concept of *functional abstraction*
- We want to represent: function calls, procedures, methods
- We will follow the same pattern:
  - 1. Language
  - 2. Small-step semantics
  - 3. Typing rules
  - 4. Show Progress and Type Preservation
- Introduce: variable binding and substitution

# Syntax

- Our language accepts *higher-order* functions
- All functions are anonymous.
- Only booleans (to simplify presentation)

 $171 \rightarrow 72$ 

\x:Bool. x

```
\x:Bool. x
```

The identity function for booleans.

\x:Bool. if x then false else true

```
\x:Bool. x
```

The identity function for booleans.

```
\x:Bool. if x then false else true
```

The boolean "not" function.

```
(\f:Bool→Bool. f (f true)) (\x:Bool. false)
```

```
\x:Bool. x
```

The identity function for booleans.

```
\x:Bool. if x then false else true
```

The boolean "not" function.

```
(\f:Bool→Bool. f (f true)) (\x:Bool. false)
```

The same higher-order function, applied to the constantly false function.

\x:Bool. x

```
\x:Bool. x
```

Bool→Bool

\x:Bool. if x then false else true

```
\x:Bool. x

Bool→Bool

\x:Bool. if x then false else true

Bool→Bool

(\f:Bool→Bool. f (f true)) (\x:Bool. false)
```

```
\x:Bool. x

Bool→Bool

\x:Bool. if x then false else true

Bool→Bool

(\f:Bool→Bool. f (f true)) (\x:Bool. false)

Bool
```

A variable: x

A variable: x

No.

Function definition: \x:T1.t2

A variable: x

No.

Function definition: \x:T1.t2

Yes!

Function application: t1 t2

A variable: x

No.

Function definition: \x:T1.t2

Yes!

Function application: t1 t2

No.

Booleans: true, false

A variable: x

No.

Function definition: \x: T1.t2

Yes!

Function application: t1 t2

No.

Booleans: true, false

Yes.

Conditional: if t1 then t2 else t3

A variable: x

No.

Function definition: \x: T1.t2

Yes!

Function application: t1 t2

No.

Booleans: true, false

Yes.

Conditional: if t1 then t2 else t3

No.

### Values

 $\frac{}{\text{value}(\lambda x : T.t)} \text{(v-abs)} \qquad \frac{}{\text{value}(\texttt{true})} \text{(v-true)} \qquad \frac{}{\text{value}(\texttt{false})} \text{(v-false)}$ 

#### Values

```
\frac{1}{\text{value}(\lambda x : T.t)} \text{(v-abs)} \qquad \frac{1}{\text{value}(\text{true})} \text{(v-true)} \qquad \frac{1}{\text{value}(\text{false})} \text{(v-false)}
```

#### Or, formally:

```
Inductive value : tm → Prop :=
    | v_abs : forall x T t,
        value (tabs x T t)
    | v_true :
        value ttrue
    | v_false :
        value tfalse.
```

#### Variable substitution

We need to represent variable substitution, because of function application.

```
(\ x:Bool. if x then true else x) false

Becomes:

if false then true else false
```

### Variable substitution

We need to represent variable substitution, because of function application.

```
(\ x:Bool. if x then true else x) false
```

Becomes:

```
if false then true else false
```

Let us define a substitution operator [x:=v] such that when applied to a term t, it replaces any occurrence of x in t by v. Care must be taken when handling function abstractions.

In the above example, we would have

```
[x := false] (if x then true else x) = if false then true else false
```

[x:=true] x

true

```
[x:=true] x
```

true

```
[x:=true] (if x then x else y)
```

```
[x:=true] x
true
[x:=true] (if x then x else y)
if true then true else y
[x:=true] y
```

```
[x:=true] x
true
[x:=true] (if x then x else y)
if true then true else y
[x:=true] y
```

[x:=true] false

```
[x:=true] false
false
[x:=true] (\y:Bool. if y then x else false)
```

```
[x:=true] false
false
[x:=true] (\y:Bool. if y then x else false)
\y:Bool. if y then true else false
[x:=true] (\x:Bool. x)
```

```
[x:=true] false
false
[x:=true] (\y:Bool. if y then x else false)
\y:Bool. if y then true else false
[x:=true] (\x:Bool. x)
\x:Bool. x
```

# Let us implement subst

#### Formal unit tests:

```
Fixpoint subst (x:string) (s:tm) (t:tm): tm:=

(* TODO *)

Goal subst x ttrue (tvar x) = ttrue. auto. Qed.

Goal subst x ttrue (tif (tvar x) (tvar x) (tvar y)) = tif ttrue ttrue (tvar y). auto. Qed.

Goal subst x ttrue (tvar y) = tvar y. auto. Qed.

Goal subst x ttrue tfalse = tfalse. auto. Qed.

Goal subst x ttrue (tabs y TBool (tif (tvar y) (tvar x) tfalse)) = tabs y TBool (tif (tvar y))

Goal subst x ttrue (tabs y TBool (tvar x)) = (tabs y TBool ttrue). auto. Qed.

Goal subst x ttrue (tabs y TBool (tvar y)) = (tabs y TBool (tvar y)). auto. Qed.

Goal subst x ttrue (tabs x TBool (tvar x)) = (tabs x TBool (tvar x)). auto. Qed.
```

### Variable substitution limitation

What does this produce?

$$[x := y] (\y:Bool. x)$$

#### Variable substitution limitation

What does this produce?

```
[ x := y ] (\y:Bool. x) (\y:Bool. y)
```

We consider such a substitution to be ill-formed. That is because y is a "global" variable defined outside the scope of function \y. Bool. x. After substitution, however, variable y refers to the parameter y of \y. Bool. x which can cause subtle bugs. In our language, we only care about programs where all variables are introduced via some function abstraction, which negates this situation. Such programs are known as **closed** programs, and these "global" variables, which are not introduced by function abstractions are known as **free** variables.

# Small-step semantics

 $rac{}{ ext{if true then }t_1 ext{ else }t_2 \Rightarrow t_1} ext{(if-true)} \qquad rac{}{ ext{if false then }t_1 ext{ else }t_2 \Rightarrow t_2} ext{(if-false)}$ 

$$rac{t_1 \Rightarrow t_1'}{ ext{if } t_1 ext{ then } t_2 ext{ else } t_3 \Rightarrow ext{if } t_1' ext{ then } t_2 ext{ else } t_3} ext{(if)}$$

# Small-step semantics

$$egin{aligned} \overline{ ext{if true then $t_1$ else $t_2$}} & \overline{ ext{if false then $t_1$ else $t_2$}} \stackrel{\text{(if-false)}}{=} \ & \frac{t_1 \Rightarrow t_1'}{ ext{if $t_1$ then $t_2$ else $t_3$}} = \overline{ ext{if $t_1'$ then $t_2$ else $t_3$}} \end{aligned}$$

### Exercise

What is the type of this expression?

```
\x: Bool. y
```

### Exercise

What is the type of this expression?

```
\x: Bool. y
```

- It depends on the type of y.
- What is the type of y?
- How do we typecheck such an expression?

## Type system

$$\frac{}{\Gamma \vdash \mathtt{true} \in \mathtt{Bool}}(\mathrm{T ext{-}true}) \qquad \frac{}{\Gamma \vdash \mathtt{false} \in \mathtt{Bool}}(\mathrm{T ext{-}false})$$

$$rac{\Gammadash t_1\in exttt{Bool}\qquad \Gammadash t_2\in T\qquad \Gammadash t_3\in T}{\Gammadash ext{ if }t_1 ext{ then }t_2 ext{ else }t_3\in T} ext{(T-if)}$$

## Type system

$$\Gamma \vdash \mathtt{true} \in \mathsf{Bool}^{}(\mathrm{T ext{-}true}) \qquad \overline{\Gamma \vdash \mathtt{false} \in \mathsf{Bool}^{}}(\mathrm{T ext{-}false})$$

$$rac{\Gammadash t_1\in exttt{Bool}\qquad \Gammadash t_2\in T\qquad \Gammadash t_3\in T}{\Gammadash ext{ if }t_1 ext{ then }t_2 ext{ else }t_3\in T} ext{(T-if)}$$

$$rac{\Gamma(x) = T}{\Gamma dash x \in T} ( ext{T-var}) \qquad rac{\Gamma \& \{x \mapsto T_p\} dash t_b \in T_b}{\Gamma dash \lambda x \colon T_p.t_b \in T_p o T_b} ( ext{T-abs})$$

$$rac{\Gammadash t_f\in T_a o T_r\quad \Gammadash t_a\in T_a}{\Gammadash t_f\ t_a\in T_r} ext{(T-app)}$$

# Summary

- Introduced the Simply-Typed  $\lambda$ -Calculus
- Introduced variable binding and substitution
- Formalized function (declaration and application) semantics
